

Preparing the Page

1. Open `profiles.php`
2. Delete the contents of the page below the first paragraph.
3. Replace the remainder with:

Select a Country Profile

The following list shows all of the countries to which we currently offer tours. To learn more about a country, follow its link.

4. Add a New Binding:

Recordset

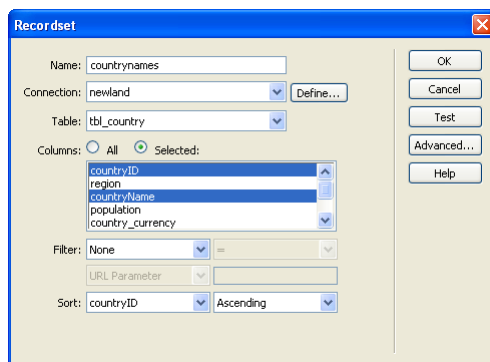

Name: `countryNames`

Connection:

Table: `tbl_country`

Selected:

```
SELECT countryID, countryName
FROM tbl_country
ORDER BY countryName ASC
```

Generating the URLs

Under the paragraph:

1. Expand the RecordSet, and add `countryName` to the page.
2. Select the `countryName` and add some nonsense to the link.
3. With the link still selected, bind the `countryID` to the `a.href`
4. Change the link to read: `profilesdetail.php?countryID=...`
5. With the link still selected add the ServerBehaviour: Repeat Region (All records)

Fixing the line spacing

6. In code view modify the code to look like this:

```
<p>

<?php do { ?>

<a href="profiles_detail.php?countryID=<?php echo
$row_rs_countryNames['countryID']; ?>"><?php echo
$row_rs_countryNames['countryName']; ?></a><br />

<?php } while ($row_rs_countryNames =
mysql_fetch_assoc($rs_countryNames)); ?>

</p>
```

Output Page

1. Copy and save the generic_template as profilesdetail.php
2. Add the RecordSet binding:

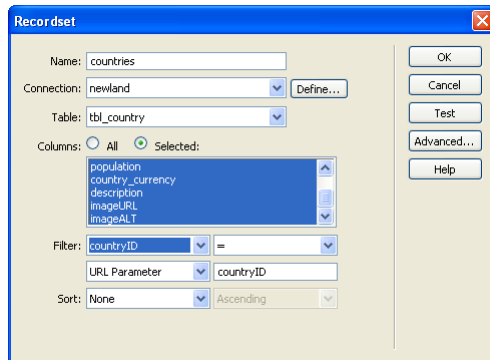

Name: rs_countries

Connection:

Table: tbl_country

Selected: (all)

Filter: countryID=URL Parameter countryID

3. In Advanced... modify the SQL as follows:

```
SELECT ... , description tbl_country.description, regionName
FROM tbl_country INNER JOIN tbl_region
ON tbl_country.region=tbl_region.regionID
WHERE ...
```

```
SELECT countryID, region, countryName, population, country_currency,
tbl_country.description, imageURL, imageALT, regionName
FROM tbl_country INNER JOIN tbl_region
ON tbl_country.region=tbl_region.regionID
WHERE countryID = colname
```

4. Add the Following:

Country Profiles

{country Name}

World Region: {regionName}

Description

{description}

Population: {population}

Local Currency: {country_currency}

Insert an image:

1. Select before {countryName}
2. Insert: Image

Data sources: images/{imageUrl}

3. Enter nonsense into the alt text.
4. Using the Tag Inspector, bind the imageALT to the img.alt text.
5. Using the Tag Attributes, copy the alt text (in General) to the title property (in CSS/Accessibility)
6. To the image, add the class attribute: profileimage
7. In CSS, add the .profile class (float: right; left-margin: 1em;)

Population

1. In code, format the population:

```
<?php echo  
number_format($row_rs_countries['population'],0,'.',''); ?>
```

Tour Descriptions Page

1. Linking to the profiles page
2. Select the text: Learn more about {countryName}
3. In the link, type in some nonsense
4. In the bindings, bind countryID to a.href
5. Modify the link to read: profilesdetail.php?countryID=...
